ATHANASIOS GOURDOMICHALIS
Java Programms
Account.java

Define the **`Account`** (bank account) class as follows:

1. The data fields of the **`Account`** class are the **interest rate** based on which the interest for the period is calculated (`double`), the **customer's name** (`String`), the **account number** (`String`), and the **account balance** (**`double`**) in euros. Assume that the interest rate is a fixed 1.5% for all accounts and for the entire time period. For this reason, define it as a **final** variable.
2. The **`Account`** class must have a **constructor** with parameters: the customer's name, the account number, and the initial balance.
3. The methods of the **`Account`** class must be the following:

```
/* Deposit: Method that performs a deposit into the
bank account. The deposit amount is passed as a
parameter.
*/

double Deposit (double Amount){
     // If the deposit amount is greater than zero,
     // it increases the account balance by the
deposit amount,
     // otherwise it displays an appropriate
message.
     // Returns the account balance.
}

/* Withdraw: Method that performs a withdrawal from
the bank account. The withdrawal amount is passed as a
parameter.
*/
```

```
double Withdraw (double Amount){
     // If the withdrawal amount is greater than zero,
     // and if the balance is greater than the
withdrawal amount,
     // it decreases the account balance by the
withdrawal amount,
     // otherwise it displays an appropriate message.
     // Returns the account balance.
}

double addInterest (){
     // Adds the interest to the account balance
     // (based on the interest rate for one period).
     // Returns the account balance.
}

double getBalance (){
     // Returns the account balance.
}

public String toString(){
     // Returns a string containing the account
details exactly
     // as shown in the example below (note the
formatting
     // of the balance with two decimal places):

     // Account Number : GR1001
     // Customer Name : FIRST LAST
     // Balance : 1500,00
}
```

Complete the Java code in the **Account.java** file.

Every program must compile and run from the command line (not through an IDE).
